-------------------------------	-----------

Background

The data for for hands-on session comes from GEO entry: GSE37704, which is associated with the following publication:

Trapnell C, Hendrickson DG, Sauvageau M, Goff L et al. “Differential analysis of gene regulation at transcript resolution with RNA-seq”. Nat Biotechnol 2013 Jan;31(1):46-53. PMID: 23222703

The authors report on differential analysis of lung fibroblasts in response to loss of the developmental transcription factor HOXA1. Their results and others indicate that HOXA1 is required for lung fibroblast and HeLa cell cycle progression. In particular their analysis show that “loss of HOXA1 results in significant expression level changes in thousands of individual transcripts, along with isoform switching events in key regulators of the cell cycle”. For our session we have used their Sailfish gene-level estimated counts and hence are restricted to protein-coding genes only.

Data Import

```
counts <- read.csv("GSE37704_featurecounts.csv", row.names = 1)
colData <- read.csv("GSE37704_metadata.csv")
```

Inspect and tidy data

Does the counts columns match the colData rows?

```
head(counts)
```

The fix here looks to be removing the first column from counts:

```
countData <- counts[,-1]  
head(countData)
```

Check for matching countData and colData

```
colnames(countData) == colData$id
```

```
[1] TRUE TRUE TRUE TRUE TRUE TRUE
```

Q1. How many genes in total?

```
nrow(countData)
```

```

```

Q2. Filter to remove zero count genes (rows here there are zero counts in all columns). How many genes are left?

```
to.keep.inds <- rowSums(countData) > 0  
new.counts <- countData[to.keep.inds, ]  
nrow(new.counts)
```

```
